

# Twist SHIMS™

## StonExpo Best of Innovation 2015

Twist SHIMS are an award winning innovation designed to make stone counter installation faster and easier. Twist SHIMS can be installed through any sub-top and adjusted from below. This allows the counter to be leveled from underneath, without having to lift the top repeatedly to move or add shims. Silicone, epoxy, caulking and other adhesives can be injected through the hollow center of the Twist SHIM, or pre-applied to bond the counters in place. Twist SHIMS can be used in corner blocks, to level seams and can be installed after the stone is in place to make repairs. With so many applications Twist SHIMS should be standard hardware on every installation truck.
